SUMMARY

Full-stack Software Engineer with 2 years of experience building production AI-agent platforms, workflow automation systems, admin consoles, RBAC and audit infrastructure, API gateways, agent deployment orchestration, cloud security pipelines, and service-side web products. Proficient across React, Next.js, TypeScript, Python, FastAPI, gRPC, Redis, Kafka, Pub/Sub and GCS.

EXPERIENCE

RUH AI

April 2025 – June 2026

Software Engineer, Product Unit (Rapid Innovation)

Remote

- Led core development of a production **Workflow Automation Builder** in React/Next.js — shipping workflow canvas UX, trigger and scheduler management, activity logs, run/stop execution controls, MCP/tool marketplace integration, Pipedream trigger flows, and AI-assisted workflow generation (Ask Ruh) with auto-import and public workflow support.
- **Refactored a 1,947-line WorkflowNode component** into modular React components, hooks, services, and utilities, reducing core complexity by ~80%, improving type safety, testability, and long-term feature velocity; added broad unit and integration test coverage across components, utils, OAuth, MCP, credential, store, and provider layers.
- Built **Super Admin and internal operations platform** end to end — covering organisations, users, AI agents, workflows, activity monitoring, credit management, subscriptions, campaigns, waitlist, marketplace review queues, inbox rotation, key management, and audit-log views.
- Implemented cross-service **multi-role RBAC, org-scoped email OTP MFA, and audit logging** across frontend, API gateway, protobuf contracts, and backend services — Redis-cached permission unions, permission guards, OTP TTL/attempt lockout, session verification stamps, and super-admin attribution in all logs and transactions.
- Built **AI model management infrastructure** across admin UI, API gateway, backend services, and protobuf contracts: OpenRouter provider/model sync, model activation toggles, global model limits, per-agent model IDs, audit logs, and filtering/pagination.
- **Reduced provider/model API surface area by 75%** by consolidating 12 separate endpoints into 3 filter-driven APIs, improving frontend integration, Swagger documentation clarity, and backend maintainability.
- Delivered **agent deployment and runtime infrastructure** for explicit agent versioning, marketplace publish/update flows, GitHub-based in-place deployment updates, runtime environment-variable reconfiguration, secret masking, staged draft/apply flows, SSE and polling progress, sandbox backup/restore, and rollback callbacks.
- Added **PI agent runtime support** across Agent Builder, API Gateway, Sandbox Orchestrator, and Agent Gateway: PI metadata parsing, .pi repo support, deployment stages, runtime config, and PI chat routing through CLI JSON mode.
- **Hardened platform security and cloud infrastructure**: rolled out Redis TLS/AUTH across 10+ services for GCP Memorystore, migrated GCS storage to private buckets with signed URLs and GKE Workload Identity, removed base64 credential usage, updated frontends to consume backend-provided CDN URLs, and fixed proxy-aware rate limiting.
- Built **legal/T&C versioning infrastructure**: proto changes, public API-driven legal pages, version history with pagination, numeric version sorting, immutable terms records, implied-acceptance logging, and dynamic notification email subjects per legal document type.
- Integrated **event-driven notification system** using Pub/Sub, Kafka, and SendGrid for auth emails, admin MFA OTPs, support tickets, platform subscriptions, agent purchases, free trial signups, credit-threshold alerts, and pre/post expiry lifecycle notifications.
- Added **Mixpanel product analytics** across auth and app flows: login/signup funnels, onboarding events, SDR agent launch tracking, campaign creation funnel steps, and persistent user context with reusable tracking hooks.
- Bootstrapped **large CI/test suites** — 350+ tests for scheduler-service and 880+ tests for notification-service — covering unit, integration, security, resilience, and contract layers with pre-commit hooks and post-deploy smoke tests.
- Applied **GenAI engineering practices**: built OpenClaw agents (soul files, SKILL.sh), worked with RAG concepts, LangChain/LangGraph prototypes, prompt engineering, LLM-assisted development flows, MCP tool integration, and Pipedream-based automation.

Rapid Innovation

June 2024 – April 2025

Associate Engineer

Remote

- **Blendbox**: Built a performance-optimized, canvas-based image blending engine; designed and implemented the Admin Panel frontend for style management and operational controls; improved rendering performance and reduced processing latency.
- **Stabull Finance** (Link): Integrated Web3 Swap and Liquidity Pool interfaces with wallet authentication; shipped secure, production-ready releases under strict timelines in collaboration with cross-functional teams.
- **Phynd** (Link): Built fully responsive UI across mobile, TV, and desktop viewports with high-quality animations and smooth cross-device interactions from design to production.
- Delivered multiple client web products involving responsive UI architecture, RESTful API integration, performance optimization, and production frontend engineering across diverse tech stacks and delivery timelines.

SKILLS

- **Languages**: TypeScript, JavaScript, Python
- **Frontend**: React.js, Next.js, React Query, TypeScript UI Architecture, Canvas UI, Low-Code Workflow Builder, Responsive/Animated UI

- **Backend:** FastAPI, REST APIs, gRPC, Microservices, API Gateway Design, Bun, Elysia
- **Database & Infra:** PostgreSQL, Redis, Redis TLS/AUTH, GCS Signed URLs, GKE Workload Identity, Kafka, Pub/Sub
- **AI / GenAI:** AI Agents, OpenClaw (soul files, SKILL.sh), RAG, LangChain, LangGraph, Prompt Engineering, MCP, Pipedream, Workflow Automation, Model Management
- **Architecture:** RBAC, MFA, Audit Logging, Scheduler Systems, Notification Systems, Agent Deployment, Cloud Security
- **Tools:** Git, Postman, Mixpanel, Linear, Jira, Figma

EDUCATION

JIMS Engineering Management Technical Campus, Delhi, India

July 2020 – July 2024

B.Tech in Computer Science Engineering

CGPA: 8.6

Relevant Coursework: Data Structures, Algorithms, Databases, Operating Systems

ACHIEVEMENTS

- Refactored a 1,947-line WorkflowNode component into modular React components, hooks, services, and utilities — reducing core complexity by ~80% and significantly improving type safety and testability.
- Reduced provider/model API surface area by 75% by consolidating 12 endpoints into 3 filter-driven APIs.
- Built cross-service RBAC, MFA, and audit infrastructure spanning frontend, API gateway, backend services, protobuf contracts, Redis, and notification flows.
- Semi-Finalist — IEEE DTU National Hackathon, Vihaan 6.0.
